

Operating Cautions – GP/DP series

■ Lubrication

Use lithium soap-based grease with excellent watertightness and heat resistance as lubricating grease and use spindle oil or turbine oil (#90~#180) as lubricating oil.

■ Additional machining of shaft end

When using the ball screw, the supported side shaft end requires additional machining.

Kuroda takes on the machining of the shaft end to maintain accuracy. Specify the intended size by referring to the attached shaft end finish ordering sheet. If the shaft-end machining is held by other than KURODA, the accuracy of the products is not guaranteed.
